

Page cache and Page fault

Changwoo Min

Summary of last lectures

- Tools: building, exploring, and debugging Linux kernel
- Core kernel infrastructure
- Process management & scheduling
- Interrupt & interrupt handler
- Kernel synchronization
- Memory management
- Virtual file system

Today: page cache and page fault

- Introduction to cache
- Page cache in Linux
- Cache eviction
- Interaction with memory management
- Flusher daemon

Latency numbers

L1 cache reference	0.5 ns	
Branch mispredict	5 ns	
L2 cache reference	7 ns	
Mutex lock/unlock	25 ns	
Main memory reference	100 ns	
Compress 1K bytes with Zippy	3,000 ns	= 3 μ s
Send 2K bytes over 1 Gbps network	20,000 ns	= 20 μ s
SSD random read	150,000 ns	= 150 μ s
Read 1 MB sequentially from memory	250,000 ns	= 250 μ s
Round trip within same datacenter	500,000 ns	= 0.5 ms
Read 1 MB sequentially from SSD*	1,000,000 ns	= 1 ms
Disk seek	10,000,000 ns	= 10 ms
Read 1 MB sequentially from disk	20,000,000 ns	= 20 ms
Send packet CA->Netherlands->CA	150,000,000 ns	= 150 ms

- Source: [Latency numbers every programmer should know](#)

Humanized version (x 1,000,000,000)

L1 cache reference	0.5 s	One heart beat (0.5 s)
Branch mispredict	5 s	Yawn
L2 cache reference	7 s	Long yawn
Mutex lock/unlock	25 s	Making a coffee
Main memory reference	100 s	Brushing your teeth
Compress 1K bytes with Zippy	50 min	One episode of a TV show (including ad breaks)
Send 2K bytes over 1 Gbps network	5.5 hr	From lunch to end of work day
SSD random read	1.7 days	A normal weekend
Read 1 MB sequentially from memory	2.9 days	A long weekend
Round trip within same datacenter	5.8 days	A medium vacation
Read 1 MB sequentially from SSD	11.6 days	Waiting for almost 2 weeks for a delivery
Disk seek	16.5 weeks	A semester in university
Read 1 MB sequentially from disk	7.8 months	Almost producing a new human being
The above 2 together	1 year	
Send packet CA->Netherlands->CA	4.8 years	Average time it takes to complete a bachelor's degree

Why caching

- Disk access is several orders of magnitude slower than memory access
- Data accessed once will, with a high likelihood, find itself accessed again in the near future → **temporal locality**

Page cache (or buffer cache)

- Physical pages in RAM holding disk content (blocks)
 - Disk is called a *backing store*
 - Works for regular files, memory mapped files, and block device files
- Dynamic size
 - Grows to consume free memory unused by kernel and processes
 - Shrinks to relieve memory pressure

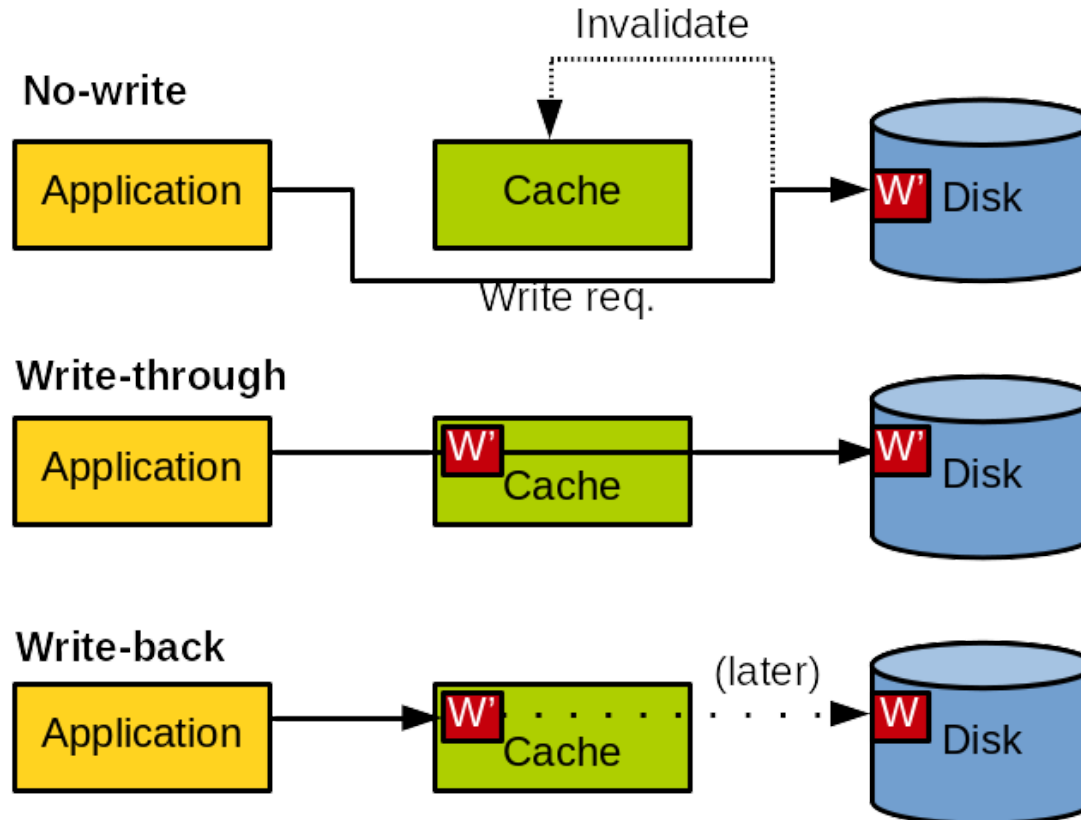

Page cache (or buffer cache)

- Buffered IO operations (without `O_DIRECT`), the page cache of a file is first checked
- **Cache hit:** if data is in the page cache, copy from/to user memory
- **Cache miss:** otherwise, VFS asks the concrete file system (e.g., ext4) to read data from disk
 - Read/write operations populate the page cache

Write caching policies

- **No-write:** does not cache write operations
- **Write-through:** write operations immediately go through to disk
 - Keeping the cache coherent
 - No need to invalidate cached data → simple
- **Write-back:** write operations update page cache but disk is not immediately updated → **Linux page cache policy**
 - Pages written are marked *dirty* using a tag in radix tree
 - Periodically, write dirty pages to disk → *writeback*
 - Page cache absorbs temporal locality to reduce disk access

Write caching policies

Cache eviction

- **When data should be removed from the cache?**
 - Need more free memory (memory pressure)
- **Which data should be removed from the cache?**
 - Ideally, evict cache pages that will not be accessed in the future
 - **Eviction policy:** deciding what to evict

Eviction policy: LRU

- **Least recently used (LRU) policy**
 - Keep track of when each page is accessed
 - Evict the pages with the oldest timestamp

- Failure cases of LRU policy
 - Many files are accessed once and then never again
 - LRU puts them at the top of LRU list → not optimal
- **Q: How to track page reference**

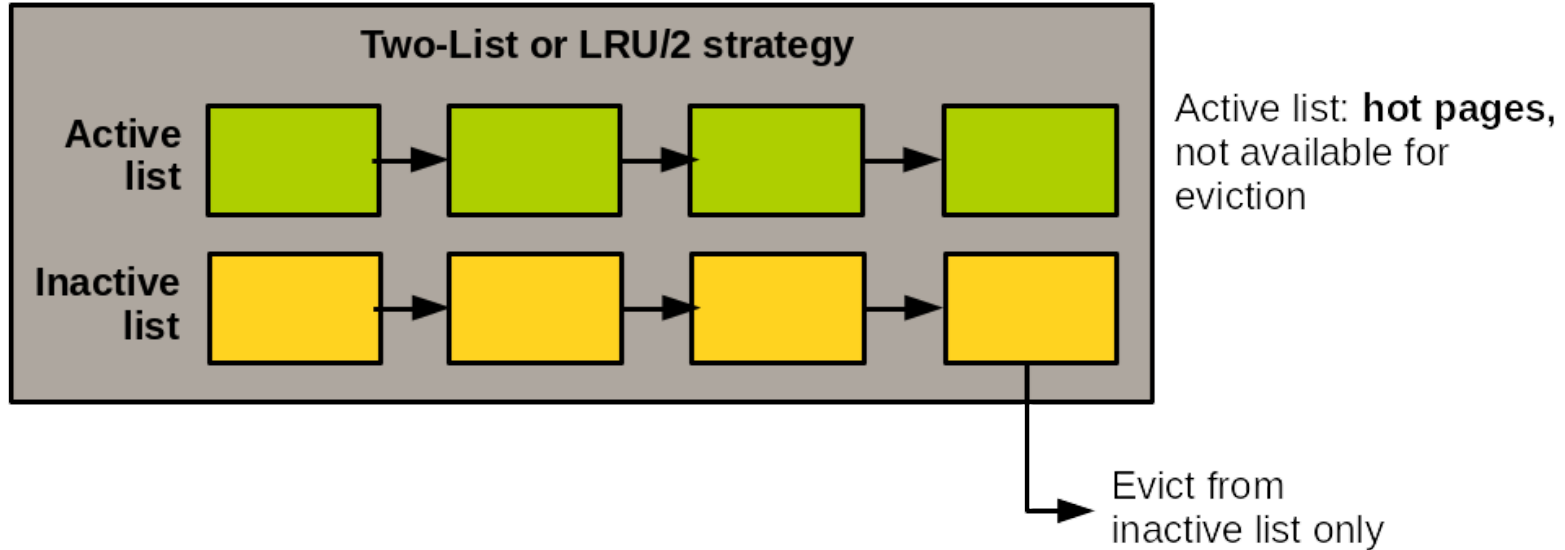

The two-list strategy

- **Active list**
 - Pages in the active list is considered *hot*
 - Not available for eviction
- **Inactive list**
 - Pages in the inactive list is considered *cold*
 - Available for eviction

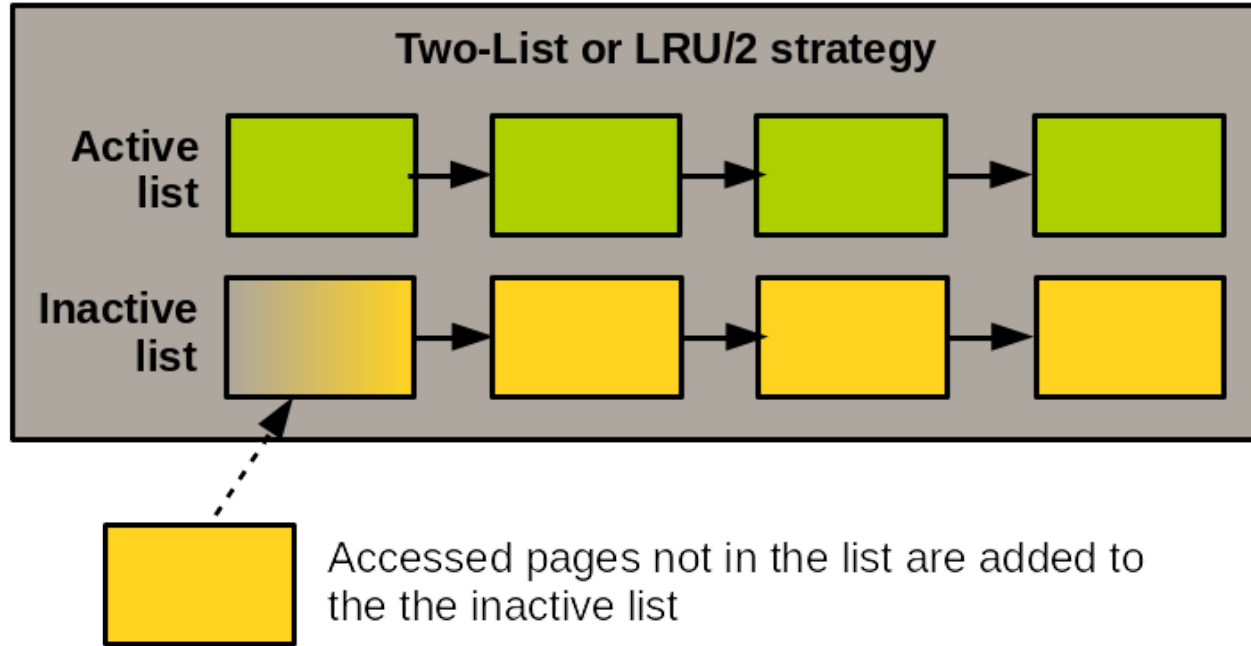

The two-list strategy

- Newly accessed pages are added to inactive list
- If a page in an inactive list is accessed again, it is promoted to an active list
 - When a page is moved to an inactive list, its access permission in a page table is removed.
- If an active list becomes much larger than an inactive list, items from the active list's head are moved back to the inactive list.
- *When a page is added to inactive list, its access permission in the page table is disabled to track its access.*

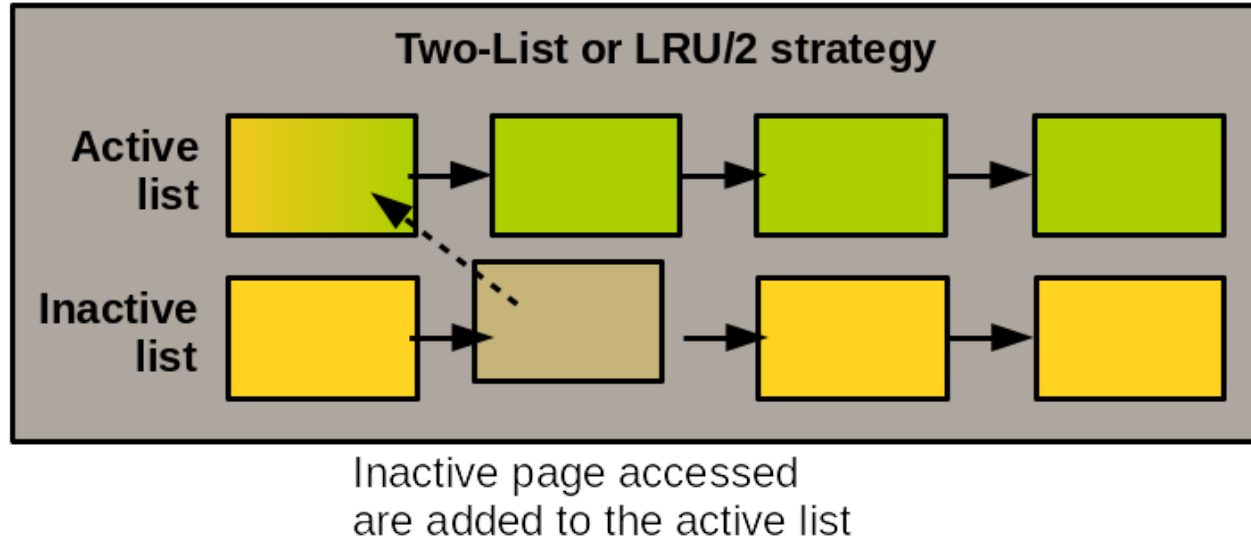

The two-list strategy

The two-list strategy

The two-list strategy

The two-list strategy

Lists are balanced and active pages are evicted in the inactive list

The Linux page cache (or buffer cache)

```
/* linux/include/linux/fs.h */
struct inode {
    const struct inode_operations    *i_op;
    struct super_block               *i_sb;
    struct address_space              *i_mapping;
    unsigned long                    i_ino;
};

struct address_space {
    struct inode                     *host;           /* owner: inode, block_device */
    struct radix_tree_root           page_tree;       /* radix tree of all pages */
    spinlock_t                       tree_lock;       /* and lock protecting it */
};

/* Insert an item into the radix tree at position @index. */
int radix_tree_insert(struct radix_tree_root *root,
    unsigned long index, void *item);

/* linux/mm/shmem.c */
static int shmem_add_to_page_cache(struct page *page,
    struct address_space *mapping, pgoff_t index, void *expected)
{
```

The Linux page cache (or buffer cache)

```
$> sudo cat /proc/1/maps
7fe87b1f1000-7fe87b21d000 r-xp 00000000 fd:00 1975147 /usr/lib64/libseccomp.so
7fe87b21d000-7fe87b41c000 ---p 0002c000 fd:00 1975147 /usr/lib64/libseccomp.so
7fe87b41c000-7fe87b431000 r--p 0002b000 fd:00 1975147 /usr/lib64/libseccomp.so

7fe87b638000-7fe87b639000 r--p 00006000 fd:00 1975989 /usr/lib64/librt-2.26.so
7fe87b639000-7fe87b63a000 rw-p 00007000 fd:00 1975989 /usr/lib64/librt-2.26.so
```

- Q: the number of `vm_area_struct`
- Q: the number of `inode`
- Q: the number of `address_space`

address_space

- An entity present in the page cache
 - an `address_space` = a file = accessing a page cache of a file
 - an `address_space` = one or more `vm_area_struct`

address_space

```

/* linux/include/linux/fs.h */
struct address_space {
    struct inode                *host;                /* owning inode */
    struct radix_tree_root      page_tree;            /* radix tree of all pages */
    spinlock_t                 tree_lock;            /* page tree lock */
    unsigned int                i_mmap_writable;       /* VM_SHARED (writable)
                                                    * mapping count */

    struct rb_root              i_mmap;              /* list of all mappings */
    unsigned long              nrpages;              /* total number of pages */
    pgoff_t                    writeback_index;      /* writeback start offset */
    struct address_space_operations a_ops;          /* operations table */
    unsigned long              flags;                /* error flags */
    gfp_t                      gfp_mask;            /* gfp mask for allocation */
    struct backing_dev_info      backing_dev_info;    /* read-ahead info */
    spinlock_t                 private_lock;         /* private lock */
    struct list_head             private_list;        /* private list */
    struct address_space         assoc_mapping;      /* associated buffers */
    /* ... */
}

```

address_space

- `i_mmap` : all shared and private mappings concerning this address space
- `nrpages` : total number of pages in the address space
- `host` : points to the inode of the corresponding file
- `a_ops` : address space operations

address_space_operations

```
/* linux/include/linux/fs.h */
struct address_space_operations {
    int (*writepage)(struct page *page, struct writeback_control *wbc);
    int (*readpage)(struct file *, struct page *);
    int (*writepages)(struct address_space *, struct writeback_control *);
    int (*set_page_dirty)(struct page *page);
    int (*readpages)(struct file *filp, struct address_space *mapping,
                     struct list_head *pages, unsigned nr_pages);
    int (*write_begin)(struct file *, struct address_space *mapping,
                       loff_t pos, unsigned len, unsigned flags,
                       struct page **pagep, void **fsdata);
    int (*write_end)(struct file *, struct address_space *mapping,
                     loff_t pos, unsigned len, unsigned copied,
                     struct page *page, void *fsdata);
    /* ... */
};
```

Page read operation

- `read()` function from the `file_operations`
 - `generic_file_buffered_read()`
- Search the data in the page cache
 - `page = find_get_page(mapping, index)`
- Adding the page to the page cache
 - `page = __page_cache_alloc(gfp_mask);`
- Then, read data from disk
 - `mapping->a_ops->readpage(filp, page)`

Page write operation

- When a page is modified in the page cache, mark it as dirty
 - `SetPageDirty(page)`
- Default write path: in `mm/filemap.c`

```
/* search the page cache for the desired page. If the page is not present,  
an entry is allocated and added: */  
page = __grab_cache_page(mapping, index, &cached_page, &lru_pvec);  
/* Set up the write request: */  
status = a_ops->write_begin(file, mapping, pos, bytes, flags, &page, &fsdata);  
/* Copy data from user-space into a kernel buffer: */  
copied = iov_iter_copy_from_user_atomic(page, i, offset, bytes);  
/* write data to disk: */  
status = a_ops->write_end(file, mapping, pos, bytes, copied, page, fsdata);
```

Interaction with memory management

- `file`, `file_operations`
 - How to access the contents of a file
- `address_space`, `address_space_operations`
 - How to access the page cache of a file
- `vm_area_struct`, `vm_operations_struct`
 - How to handle page fault of a virtual memory region
- Page table in x86 processor

file

```

/* linux/include/linux/fs.h */
struct file {
    struct path                f_path;
    struct file_operations *f_op;
    spinlock_t                f_lock;
    atomic_t                  f_count;
    unsigned int              f_flags;
    mode_t                    f_mode;
    loff_t                    f_pos;
    struct fown_struct        f_owner;
    const struct cred *f_cred;
    struct file_ra_state f_ra;
    u64                      f_version;
    void *private_data;
    struct list_head          f_ep_link;
    spinlock_t                f_ep_lock;
    struct address_space *f_mapping;
    /* ... */
};

```

/ contains the dentry */*

file

```
/* linux/include/linux/fs.h */
struct file_operations {
    struct module *owner;
    loff_t (*llseek) (struct file *, loff_t, int);
    ssize_t (*read) (struct file *, char __user *, size_t, loff_t *);
    ssize_t (*write) (struct file *, const char __user *, size_t, loff_t *);
    ssize_t (*read_iter) (struct kiocb *, struct iov_iter *);
    ssize_t (*write_iter) (struct kiocb *, struct iov_iter *);
    int (*iterate) (struct file *, struct dir_context *);
    int (*iterate_shared) (struct file *, struct dir_context *);
    unsigned int (*poll) (struct file *, struct poll_table_struct *);
    /* ... */
};
```

address_space

```

/* linux/include/linux/fs.h */
struct address_space {
    struct inode                *host;                /* owning inode */
    struct radix_tree_root      page_tree;            /* radix tree of all pages */
    spinlock_t                 tree_lock;            /* page tree lock */
    unsigned int                i_mmap_writable;        /* VM_SHARED (writable)
                                                    * mapping count */

    struct rb_root              i_mmap;              /* list of all mappings */
    unsigned long              nrpages;              /* total number of pages */
    pgoff_t                    writeback_index;      /* writeback start offset */
    struct address_space_operations a_ops;          /* operations table */
    unsigned long              flags;                /* error flags */
    gfp_t                      gfp_mask;            /* gfp mask for allocation */
    struct backing_dev_info      backing_dev_info;    /* read-ahead info */
    spinlock_t                 private_lock;         /* private lock */
    struct list_head            private_list;         /* private list */
    struct address_space        assoc_mapping;        /* associated buffers */
    /* ... */
}

```

address_space

```
/* linux/include/linux/fs.h */
struct address_space_operations {
    int (*writepage)(struct page *page, struct writeback_control *wbc);
    int (*readpage)(struct file *, struct page *);
    int (*writepages)(struct address_space *, struct writeback_control *);
    int (*set_page_dirty)(struct page *page);
    int (*readpages)(struct file *filp, struct address_space *mapping,
                    struct list_head *pages, unsigned nr_pages);
    int (*write_begin)(struct file *, struct address_space *mapping,
                    loff_t pos, unsigned len, unsigned flags,
                    struct page **pagep, void **fsdata);
    int (*write_end)(struct file *, struct address_space *mapping,
                    loff_t pos, unsigned len, unsigned copied,
                    struct page *page, void *fsdata);
    /* ... */
};
```

vm_area_struct

```

struct vm_area_struct {
    struct
        unsigned long          mm_struct *vm_mm; /* associated address space */
        unsigned long          vm_start;         /* VMA start, inclusive */
        unsigned long          vm_end;           /* VMA end, exclusive */
        struct vm_area_struct    *vm_next;        /* list of VMAs */
        struct vm_area_struct    *vm_prev;        /* list of VMAs */
        pgprot_t                vm_page_prot;     /* access permissions */
        unsigned long          vm_flags;         /* flags */
        struct rb_node           vm_rb;           /* VMA node in the tree */
        struct list_head         anon_vma_chain; /* list of anonymous mappings */
        struct anon_vma          *anon_vma;       /* anonmous vma object */
        struct vm_operation_struct *vm_ops;       /* operations */
        unsigned long          vm_pgoff;         /* offset within file */
        struct file              *vm_file;       /* mapped file (can be NULL) */
        void                    *vm_private_data; /* private data */
    /* ... */
}

```

vm_area_struct

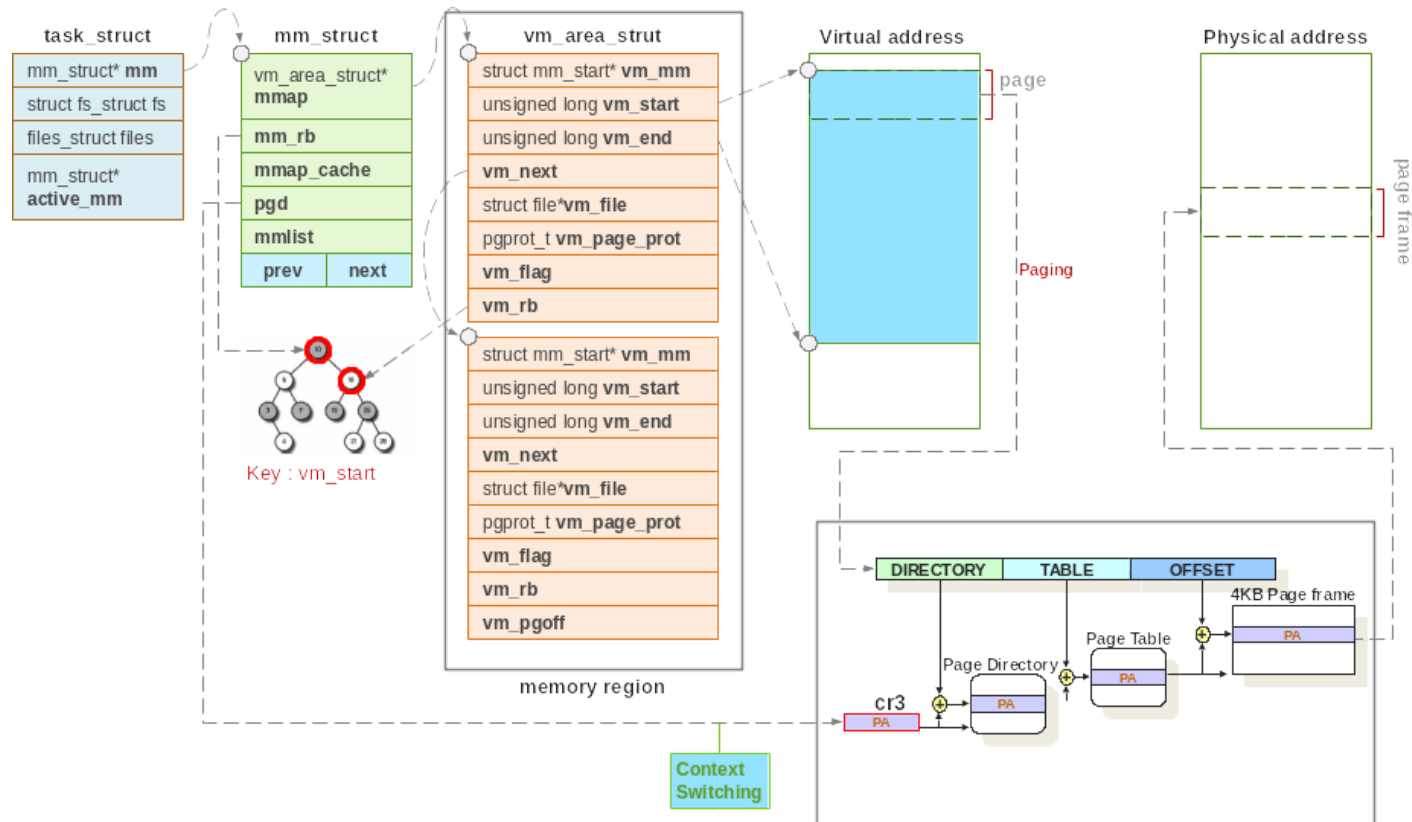

```
/* linux/include/linux/mm.h */
struct vm_operations_struct {
    /* called when the area is added to an address space */
    void (*open)(struct vm_area_struct * area);

    /* called when the area is removed from an address space */
    void (*close)(struct vm_area_struct * area);

    /* invoked by the page fault handler when a page that is
     * not present in physical memory is accessed*/
    int (*fault)(struct vm_area_struct *vma, struct vm_fault *vmf);

    /* invoked by the page fault handler when a previously read-only
     * page is made writable */
    int (*page_mkwrite)(struct vm_area_struct *vma, struct vm_fault *vmf);
    /* ... */
}
```

vm_area_struct - page table

Page cache - physical page

Page fault handling

- Entry point: `handle_pte_fault` (mm/memory.c)
- Identify which VMA faulting address falls in
- Identify if VMA has a registered fault handler
- Default fault handlers
 - `do_anonymous_page` : no page and no file
 - `filemap_fault` : page backed by file
 - `do_wp_page` : write protected page (CoW)
 - `do_swap_page` : page backed by swap

File-mapped page fault:

`filemap_fault`

- PTE entry does not exist (`---`)
- BUT VMA is marked as accessible (e.g., `rwX`) and has an associated file (`vm_file`)
- Page fault handler notices differences
 - In `filemap_fault`
 - Look up a page cache of the file
 - If cache hit, map the page in the cache
 - Otherwise, `mapping->a_ops->readpage(file, page)`

Copy on Write: `do_wp_page`

- PTE entry is marked as un-writable (e.g., `r - -`)
- But VMA is marked as writable (e.g., `rw -`)
- Page fault handler notices differences
 - In `do_wp_page`
 - Must mean CoW
 - Make a duplicate of physical page
 - Update PTEs and flush TLB entry

Flusher daemon

- Write operation are deferred, data is marked *dirty*
 - RAM data is out-of-sync with the storage media
- Dirty page writeback occurs
 - Free memory is low and the page cache needs to shrink
 - Dirty data grows older than a specific threshold
 - User process calls `sync()` or `fsync()`
- Multiple **flusher threads** are in charge of syncing dirty pages from the page cache to disk

Flusher daemon

- When the free memory goes below a given threshold, the kernel `wakeup_flusher_threads()`
 - Wakes up one or several flusher threads performing writeback though `bdi_writeback_all`
- Thread write data to disk until
 - `num_pages_to_write` have been written
 - and the amount of memory drops below the threshold
- percentage of total memory to trigger flusher daemon
 - `/proc/sys/vm/dirty_background_ratio`

Flusher daemon

- At boot time a timer is initialized to wake up a flusher thread calling `wb_writeback()`
- Writes back all data older than a given value
 - `/proc/sys/vm/dirty_expire_interval`
- Timer reinitialized to expire at a given time in the future: now + period
 - `/proc/sys/vm/dirty_writeback_interval`
- Multiple other parameters related to the writeback and the control of the page cache in general are present in `/proc/sys/vm`
 - More info: `Documentation/sysctl/vm.txt`
